

News from 9th October 2010

IMPORTANT Information:

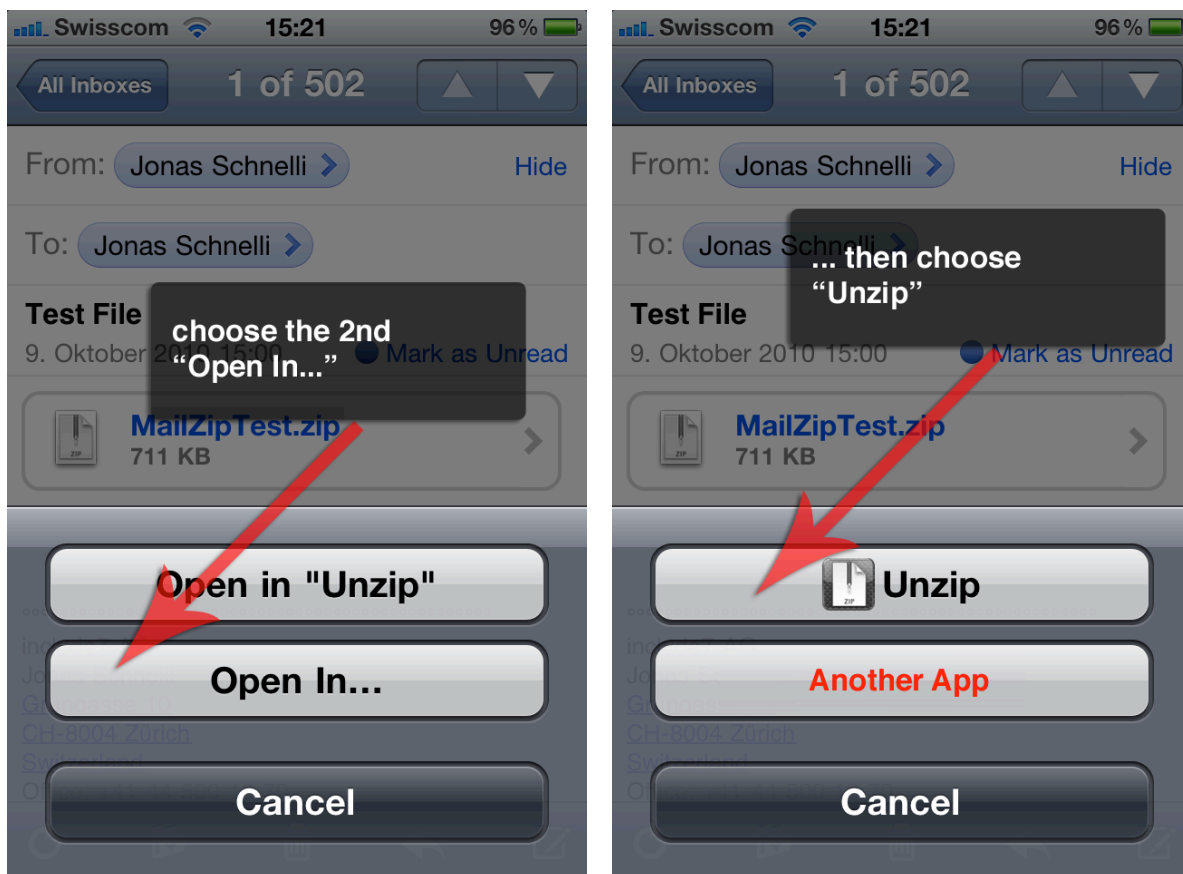

ZIP Files which contains only one file causes Mail.app to crash.

This is a bug in the iOS 4.0, 4.0.1 and 4.1.

It's because Mail.app will automaticly expand ZIP Files with only one file.

Workaround:

If you have a another „open in...“ application installed (p.E. Goodreader), you can choose the second „open in...“ and Mail.app won't crash.

We hope that apple is fixing this bug very soon.

Thanks for using Unzip (from Mail and Safari)
